Notes:
Site Dust Contribution Concentration = Downwind – Upwind Dust Difference
µg/m^3 = micrograms per cubic meter
Dust Action Level for Rule 403
2-hour rolling averages
Measurements shown reflect 24 hours per day/7 days per week

Site dust contribution represents the dust that may be leaving the Site. This is determined by subtracting upwind data (dust blowing onto the Site from other sources) from downwind data. This helps us monitor that dust control actions are effective. A negative value means that the dust concentration is higher coming onto the Site.

Onsite Dust Monitoring
Site Contribution Dust
Ascon Landfill Site

Notes:
Site VOC Contribution Concentration = Downwind – Upwind VOC Difference
VOC = volatile organic compound; ppm = parts per million
VOC Action Level for total VOCs
1-minute rolling averages
Measurements shown reflect 24 hours per day/7 days per week

Site VOC contribution represents VOCs that may be leaving the Site. This is determined by subtracting upwind data (VOCs coming onto the Site from other sources) from downwind data. A negative value means that the VOC concentration is higher coming onto the Site.
