

Notes:

Site Dust Contribution Concentration = Downwind – Upwind Dust Difference

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

Dust Action Level for total dust during active work

2-hour rolling averages

Measurements shown reflect 24 hours per day/7 days per week

Site dust contribution represents the dust that may be leaving the Site. This is determined by subtracting upwind data (dust blowing onto the Site from other sources) from downwind data. This helps us monitor that dust control actions are effective. A negative value means that the dust concentration is higher coming onto the Site.

Notes:

Site VOC Contribution Concentration = Downwind – Upwind VOC Difference

VOC = volatile organic compound; ppm = parts per million

VOC Action Level for total VOCs during active work

1-minute rolling averages

Measurements shown reflect 24 hours per day/7 days per week

Site VOC contribution represents VOCs that may be leaving the Site. This is determined by subtracting upwind data (VOCs coming onto the Site from other sources) from downwind data. A negative value means that the VOC concentration is higher coming onto the Site.
